“Racial and Socioeconomic Inequity in the Spatial Distribution of LGBTQ Human Services: an Exploratory Analysis of LGBTQ Services in Chicago” by Kris Rosentel; Alicia VandeVusse; Hill, J Brandon examines the intersectionality between members of the LGBTQIA+ community, people of color, and people from low socioeconomic status. This text focuses on members of these groups that reside in the area of Chicago. This article placed an emphasis on the distribution of programming tailored specifically towards members of the LGBTQIA+ community. Geocoding was the method used to conduct this research and it revealed that there was a disproportion between the amount and quality of LGBTQIA+ supportive programs in less affluent neighborhoods. Additionally, the neighborhoods that lacked these programs were comprised of mostly Black and Latino families.

Rosentel, VandeVusse, and Hill published this work with the intent of impacting the equity built around LGBTQIA+, people of color, and people from low socioeconomic status. By doing so they appropriately address the lack of career based programs in the neighborhoods these people live in. This source helps further my research by focusing in on intersectionality and provides direct causation for low employment amongst members of the LGBTQIA+

community. I plan on using this source to support my ideas with regard to the importance of equity and the role of city officials in the distribution of resources.
