#### **Annotation 4**

“LGBTQ + STEM” is an online platform for a network of global Queer professional with careers related to science, technology, engineering, and math. university Staff, LGBT associations, and seminars are just a few of the great resources that this site has to offer. There is also a map feature that displays all of the people affiliated with the site across the world. When a person decides to share their story, they are give some useful informations such as their current job, scientific discipline/field, How did you get to this job (education etc.)?, Do you feel being LGBT has affected your career decisions, and What does your job involve?. These questions make each interview and blog post brief yet informative.

First hand sources were the main things that came to my mind when I decided to write about the LGBTQIA+ community. Being that I do not identify as a member but more of an ally, I wanted to find a variety of voices that could speak on the experiences of being Queer in corporate America. This website published a multitude of articles from interviews of LGBTQIA+ STEM professionals providing a safe space for both members of the community to speak on their experiences and allies to learn from them. This website contrasts the idea that oppression is unary by showing the different forms

inequity can take. The most surprising part about this website is that it not only serves as a place for people to come and learn merely reading articles, it also allows for open discussion through comment sections under each post.
